Question - 5.5

If each element of a second order determinant is either zero or one , what is the probability that the value of the determinant is positive ? (Assume that the individual entries are chosen independently each value being assumed with probability 1/2)

Solution :

Total number of entries in the matrix are 4. Let X = 0,1 be a random variable denoting the possible value for each entry.

$$\Pr(X = 0) = \frac{1}{2}$$
$$\Pr(X = 1) = \frac{1}{2}$$

For the determinant of the matrix to be positive first and fourth entries should be 1 and at least one among the other two should be zero

$$= \Pr(X = 1)\Pr(X = 1)(1 - (\Pr(X = 1)\Pr(X = 1)))$$
$$= \frac{1}{4}(1 - \frac{1}{4})$$
$$= \frac{3}{16}$$
